Energy is considered one of the most critical nutrients in a balanced dairy or beef ration. It is normally the first limiting nutrient that needs to be supplemented, whereas in most feeding systems protein and fibre are normally present in sufficient quantities.

Citrus Pulp as a co-product provides an economical and unique source of energy ensuring a highly palatable stock feed. Citrus energy offers high energy without causing sub-acute ruminal acidosis (SARA) commonly resulting from high starch feeds.

SARA is considered a major cause of low milk production and low butter fat percentage.

Apart from energy, Citrus Pulp also includes, digestible fibre, pectin and soluble sugars.

Citrus Pulp complements high protein grasses. It breaks down at the same rate as the soluble protein found in grass pastures which lead to improved feed efficiency and increased milk production

#### **Citrus Pulp with silage.**

Citrus Pulp can be used in combination with high protein crops as it improves the availability of digestible energy in the silage as well as retain valuable nutrients for more effective bacterial fermentation during ensiling.

#### **Feeding Guide**

- For cattle only, it can be fed at a rate of up to 12.5kg fresh weight per cow per day.
- Shelf life needs to be considered when formulating rations.

#### **Additional notes**

The above information is to be used as a guide only and not to be used as the basis for recommendations.

Ensure clean fresh drinking water are always available.

Please consult with your nutritional advisor to determine the appropriate inclusion rates for your nutritional situation
