Hominy Meal is the co-product produced by re-milling the recombined fractions from the maize dry milling process for producing maize grits. It contains the bran, tip caps, germ, and tailing streams from maize kernels in a blend consisting of coarse, medium and fine grind material.

Hominy Meal is a valuable ingredient to add into dairy, beef and pig feed rations

Hominy Meal is an excellent grain replacement in ruminant diets especially in grower and finisher diets. Hominy Meal is high in starch, with moderate fibre and useful protein.

Hominy Meal has a rather low effective protein degradability, and is considered as a medium provider of metabolisable protein. Diets included with Hominy Meal usually require supplemental protein to achieve optimum growth performance.

Hominy meal is very useful in cattle diets especially for its palatability in promoting intake and digestibility for young growing livestock but also for lactating dairy cows as well as in finishing diets.

Hominy Meal's composition is close to that of maize grain and can be used as an energy source alone or in combination with grain for dairy cows fed silages. Likewise, Hominy Meal containing 47% starch (DM) can be used as the main energy supplement (28-35% diet DM) offered to lactating cows fed silages, resulting in similar performance as that obtained with ground maize or steamed-flaked maize.

Hominy Meal is also considered an excellent feed for pigs

Feeding Guide

- For lactating cows and beef cattle can be utilised up to 40% of mixed ration but needs adequate effective fibre source to balance.

- For pigs can be utilised up to 20% in breeder, weaner and grower diets but is best restricted to less than 10% in finisher diets.

- Shelf life needs to be considered when formulating rations.

Additional notes

The above information is to be used as a guide only and not to be used as the basis for recommendations.

Ensure clean fresh drinking water are always available.
